There are two main ways to alter the appearance of your artwork: the color replacement tool and the fill tool . It is good to know the difference, and how to use them, even if for the time being you plan to make only minor adjustments. Further into the process, when you begin to tune the artwork to its final appearance, it becomes easy to make large-scale alterations with the layer mask feature .

In this part we'll show you how to use the brush tools to make precise adjustments to a photo's color. In the next part, we'll step up in scale to image color modification and how to make some larger modifications with the curve tool . Finally, in the next part we'll take a look at using color in the offset-gradient tool to make large-scale changes to the appearance of an image.

That's a lot to unpack, so take advantage of the hand-holding that we're about to give you. Let's start with the first of the two main tools you'll use to make color adjustments in Photoshop: **the color replacement tool**. Look at the color of your reference image and decide which color you'd like to use to make your new image look like. Then grab a pixel out of your reference image, drag it into your Photoshop canvas, and watch your color change over there in Photoshop. If you want a more fine-grained approach, go ahead and change the color just a pixel at a time.

As you can see, the color replacement tool works in two mouse clicks. First, select the color you want to use to create your new artwork, and next click the Replace Color button. Now all the pixels in the image will be replaced with the color you specified. If you'd like to be more precise, you can also change your color while you have the pixel as a layer selected. To do that, hold down the Option key while you drag and move the color into your artwork.
